

# NetFreight

- Web Based
- Freight Management
- Customs Clearance
- WMS
- CRM

# Amalgamate multiple freight related systems into one

Save money and improve operational efficiency by combining all your individual freight systems into one software package.

NetFreight can combine Freight Management, CRM, Rates, Track & Trace, Document Generation, Invoicing, Frontier Customs Clearance and a lot more into one easy to use and distributable solution.

Access or use from anywhere in the world, network your global operation without paying for a bespoke solution. NetFreight is an off the shelf package that can give you the edge you're looking for, all at a low-cost user rental.

*“ When we merged two long established companies to form Kingscote Rojay Ltd in 2008 we were faced with the daunting challenge of having to replace a cocktail of six software packages (Boxtop, ASM, FreighForce, DataFreight and Impatex in the UK, and IES in the US) to achieve both improved efficiency and an overall cost saving. Having looked in great depth at what we had and the available options, we knew that the choice we made had to meet not only all our current needs but have the flexibility and potential to grow with us. NetFreight met the challenge and worked with us to meet those demands. We couldn't have made a better decision! ”*

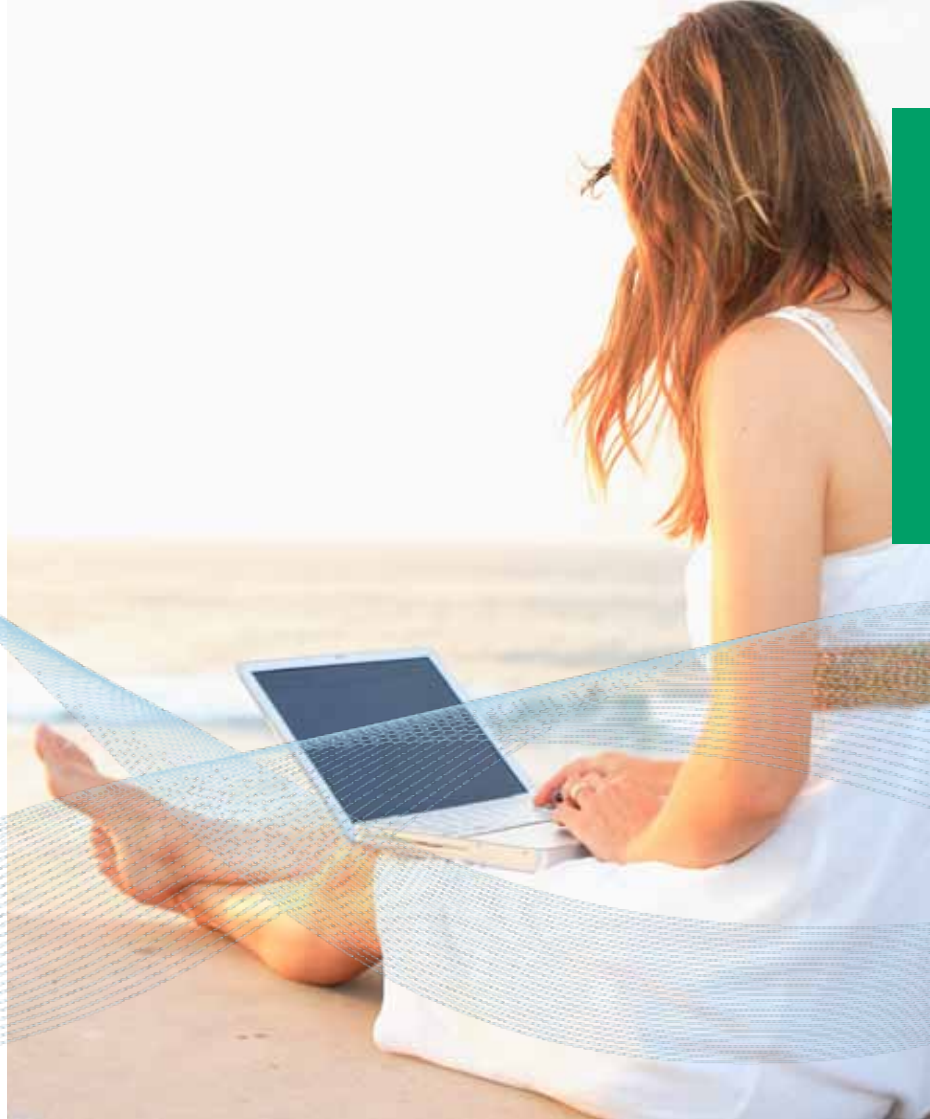

**Joe Hales - Managing Director, KRL**

# Fully web-based, to stay ahead of the times

No need for expensive Terminal Servers and Citrix/Terminal Services Client Access Licences (CAL's).

You only need a web server to share it from.

NetFreight can be accessed by any web browser, over the web, VPN, WAN or LAN.

# iPhone and iPad access for both staff and customer tracking

Whether you want your field staff to access contacts and CRM while on the road, or issue your customer the ability to track their consignments from the convenience of their iPhone or iPad, NetFreight can accommodate.

# Easily network with overseas agents and customers

Just issue any global party a logon for them to pre-book jobs direct onto your system, we don't even charge for these users!

They then create the data and upload documents for you to transfer into a job or entry, cutting down man hours and transcription errors.

# Globally manage & control multimodal movement operations

Being fully multimodal for Air, Sea, Road, Courier and Domestic, NetFreight can look after all of your movement requirements.

Only enter the data relevant to that mode of transport for ease of use and better productivity.

Also, because it's web-based, NetFreight is ideal for overseas offices who can access it over the web or VPN very cheaply and efficiently.

*“ The great thing about NetFreight is that it is completely web-based, so that not only can our staff use it in the UK office and I can easily access it when I'm out of the office, but it can also be used from our overseas offices in New Zealand and Nigeria, who can access it easily and cheaply over the web. ”*

**Wellington Majora - Managing Director, Vadomark**

# Fully integrated track & trace

Our Track & Trace lets customers view Jobs, Warehouse Stock and latest Tariff Rates along with Pre-booking Jobs and Request Quotations.

Issue as many logins as you wish to your customers and agents; let them do the work for you.

# Integrated Warehouse Management System (WMS)

Look after multiple warehouses and zones with the warehousing management facility.

Having this integrated means you can convert haulage and clearance jobs out of the warehouse data, saving time and offering a higher level of control; improving company efficiency.

*“ We used NetFreight in New York and LA before switching to Boxtop because NetFreight did not then have a warehousing facility, but as soon as it did, we switched back to NetFreight, which the users preferred because it was more flexible on documents and labels and more efficient to run remotely because of it being web-based rather than Windows. ”*

**Richie Stefanello - Warehouse Manager, Worldnet USA**

# Automated rates and quotation management

The cutting edge rates management facility lets you bulk upload all types of multimodal contract rates into the system; then the system does the work for you.

Look after your customer's tariffs and quotes easily and intuitively, release them to your customer either via the Track & Trace or spot quotation. Convert quotes to jobs, jobs to entry's, entry's to invoices.

# Inbuilt UK, US and EU frontier Customs clearance capability

Impatex have specialised in Customs clearance software for over 30 years and our software is used by most of the major 'Corporate' forwarders and 100's of SME's.

We have taken our extensive experience and implemented Customs clearance capability into NetFreight to deliver a well rounded, integrated freight forwarding and Customs package for the UK, US and EU.

*“ We’ve been a user of Impatex’s Customs software for years in ocean freight, but used ASM for airfreight. With NetFreight we were able to combine forwarding with Customs for both ocean and air freight, and now also use it for Customs in addition to forwarding in our New York office. ”*

**Mike Mantel - Director, Immediate Transport**

# Import Control System (ICS) message transmission capability

In-built ICS capability means you can transmit messages using the data already input into the job file.

Alternatively, send the FWB and FHL messages to the airlines so they can do the ICS messages.

# Workflow operation process

One of the major benefits to a central solution is that you don't have to enter any data for a job more than once; all information is shared in the system.

In fact, overseas agents can pre-book jobs, which you can convert into actual jobs, which can auto-populate a Customs entry, meaning they do much of the work for you!

'Milestones' can be user-defined so staff and customers can see what stage the job has reached.

# Integrated Customer Relationship Management (CRM)

Utilise the inbuilt CRM, both out on the road or in the office.

Offering you the ability to set targets and desired outcomes for your clients and easily manage how you are going to achieve them.

*“ In addition to all the great functions in NetFreight, we use the CRM facility extensively at Meridian to keep track of our sales and marketing with customers and more importantly potential customers. NetFreight’s inbuilt CRM is designed specifically for use by freight forwarders and therefore is more suitable than generic CRM packages at extra cost. ”*

**Geoff Swan - Managing Director, Meridian Freight**

# Integrated financial management

Create invoices from quotes, cost allocation and accruals, for superior financial control at job and customer level.

We even communicate to most of the major accounts packages for financial control of the business.

# Bespoke report generation

In the world of business, we all need reports on what has been done, so we can improve on what we do.

NetFreight includes a report generator so users can create their own bespoke reports from the data within NetFreight.

Reports can also be output as Excel spreadsheets for further data manipulation by staff and/or customers.

*“ Apart from being a very powerful freight management system which Skyline uses in the UK and Skylink in the US, NetFreight’s reporting capability is very strong because the software is based on an SQL database which can be queried for any data fields. Whatever reports that we have needed have been made available, and with the report generator, we will be able to design our own reports. ”*

**Kevin Connelly - Managing Director, Skyline**

# Multilingual Capability

The terminology on fields can be changed to accommodate different languages or descriptions.

This is especially useful when rolling out NetFreight globally.

# Document storage & retrieval

Attach documents to any job, or customer. Overseas agents can attach documents to their pre-bookings, saving the need to send and keep emails.

By storing your documents against your jobs digitally, means you don't need to keep all those paper files on your desk or in filing cabinets.

Access historical jobs and see the documents without having to dig paperwork out of archive.

*“ NetFreight was the natural replacement for FreightForce, but with the added advantage of being web-based for easy remote access. The document storage and retrieval system in NetFreight is however very powerful, as external documents can be scanned and automatically stored against the job using the Job Reference. ”*

**Robert Molloy - Director, Foremost Group**

# Control over users

NetFright incorporates powerful user profiles for permission to use certain aspects of the software, with customisable menus.

Management can see who has done what, when, and any changes to the job files with the audit and milestone facility.

Impatex pioneered 'Intelligent' DTI over 30 years ago, and are the leading supplier of Customs software in the UK, with most of the major 'Corporate' forwarders and 100's of SMEs using its Customs Manager software.

Now with NetFreight, Impatex are also a leading supplier of freight management software which also incorporates warehouse management, CRM and links to UK, US and EU Customs.
